

ABSTRACT

1  
2  
3  
4       A stackable refuse collection container including a body  
5 having a bottom and an open top, the body constructed to be  
6 nestingly stacked with at least one similar body through the  
7 open top. A cover is formed to engage the body and close the  
8 top. An engagement mechanism is coupled to the body and the  
9 cover, the engagement mechanisms moveable between an engaged  
10 position securing the cover onto the body to allow compaction  
11 of refuse therein, and a disengaged position permitting removal  
12 of the cover from the open top. A loading door is formed in an  
13 end of the body for receiving refuse from a compactor  
14 mechanism.
